Get Kyc Details:

Description: This API is used to get the details of KYC that exist with the KSPL system. Pan Data can be downloaded with this Service. Include the token generated from GetClient API Token in Authorization Header as a Bearer Token in this API.

Response Validation Logic

Upon receiving the response from the Fetch API, the following validation must be performed:

1. Check the following fields returned by the API:

- exmt i.e APP_EXMT
- corr add 1 i.e APP_COR_ADD_1
- per add 1 i.e APP_PER_ADD_1
- investortype i.e APP_TYPE

2. Validation Rule:

- If **all four fields** (exmt, corr add 1, per add 1, investortype) are **blank or empty**, the Fetch response must be treated as an **Invalid Fetch**.
- In this case, refer to the **error description** (errorDescription or equivalent error field in the response) to display or log the correct error message.

3. Success Rule:

- If **any one or more** of the above fields contains valid (non-blank) data, the response must be treated as a **successful fetch**.

This validation ensures that genuine KYC records are processed correctly, and system or upstream issues are clearly identified through meaningful error messages.

- The ADDL_INFO child tag is applicable only to non-individual records.
- The GDNDIS_SPLABLD_DTLS child tag is applicable only to minor KYC cases.
